

Problem Statement

Retail Store Sales & Purchase Analysis

Retail businesses generate thousands of transactions across multiple store locations, store types, and product categories. Without an interactive analytics solution, it becomes difficult for management to identify sales trends, customer purchasing behavior, regional performance, and category-wise spending.

The objective of this project is to build an interactive **Power BI Dashboard** that enables stakeholders to:

- Monitor total sales and purchase amounts.
- Compare performance across different store locations and store types.
- Analyze indoor and outdoor sports product spending.
- Understand customer spending across different age groups.
- Identify high-performing and low-performing stores.
- Enable data-driven decision-making through interactive filters and visualizations.

This dashboard transforms raw retail transaction data into meaningful business insights for managers and decision-makers.
